# Questions

- Why isn't there just one archive? Why isn't there an API to help me search for data?
- Why is it so hard to find metadata?
- Why don't all RINEX files have SNR data in them?
- Why don't people/organizations track modern GPS signals? If it isn't in the online files, can I find it elsewhere? How can I tell if my file has L2C in it?
- Why are most GNSS data stored at 30 second sampling? Why is that a bad thing?
- Why are high-rate data stored in 96 separate 15 minute files? Why won't the GNSS archives change this?
- Why are there two RINEX formats and does it matter?
- Why do people use elevation masks ? How can you stop them from doing this?
