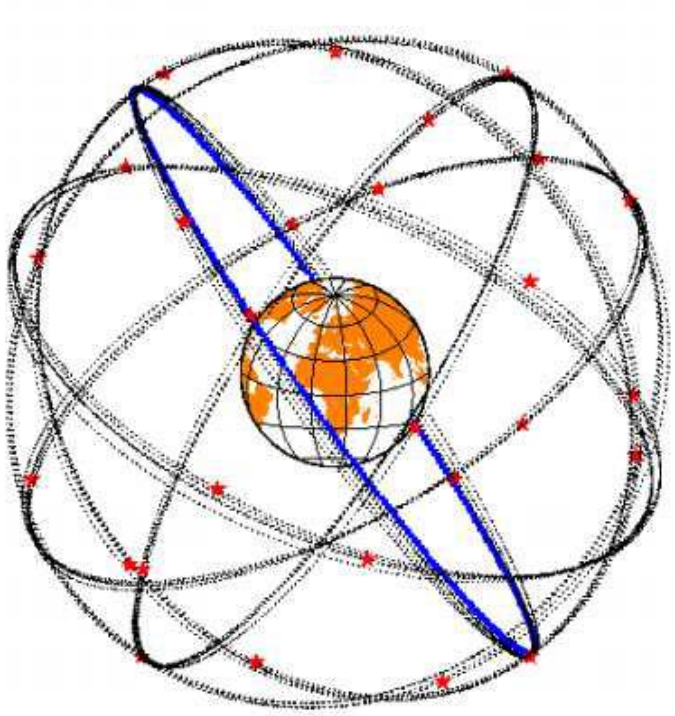
Summary

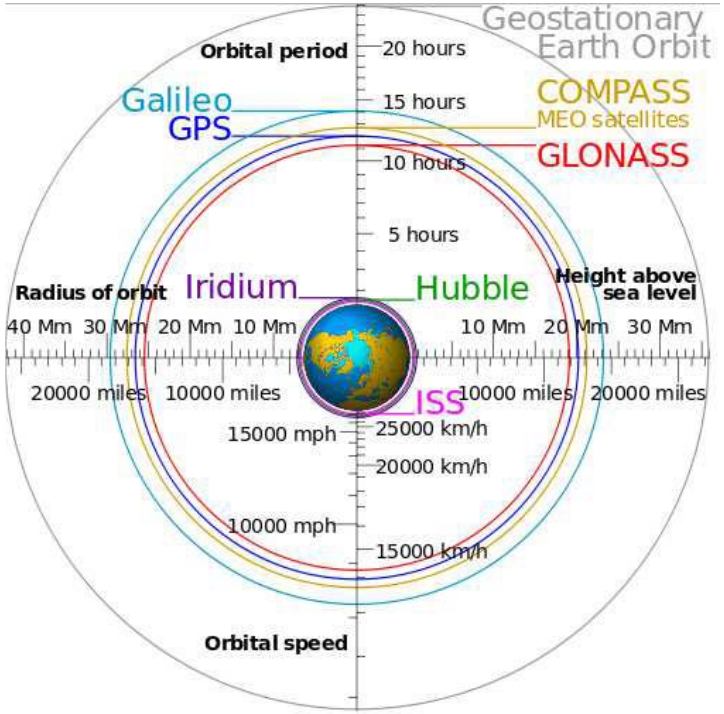
1) Context
2) Principles
3) Geometry
4) Physics
5) Fitting

Geremia-Nievinski (2022) "Low-Cost Ground-Based GNSS Reflectometry",
In: *Encyclopedia of Geodesy*, https://doi.org/10.1007/978-3-319-02370-0_175-1
Also available from: https://www.researchgate.net/publication/365173903

GNSS orbital constellations



Inclination ~ 55 deg.

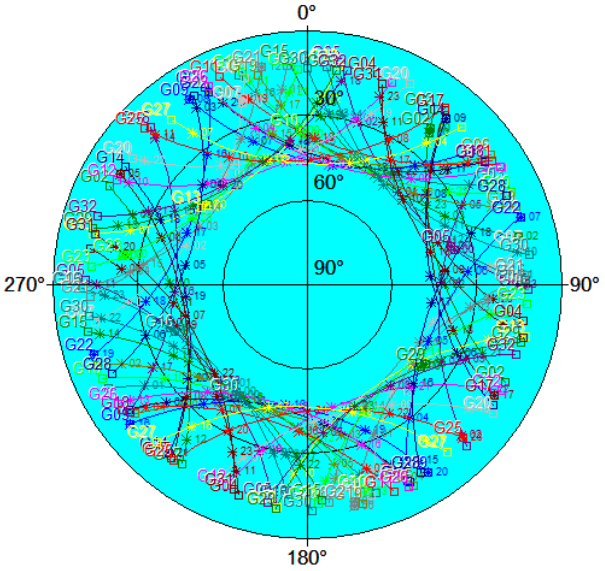


Altitude ~ 20,000 km

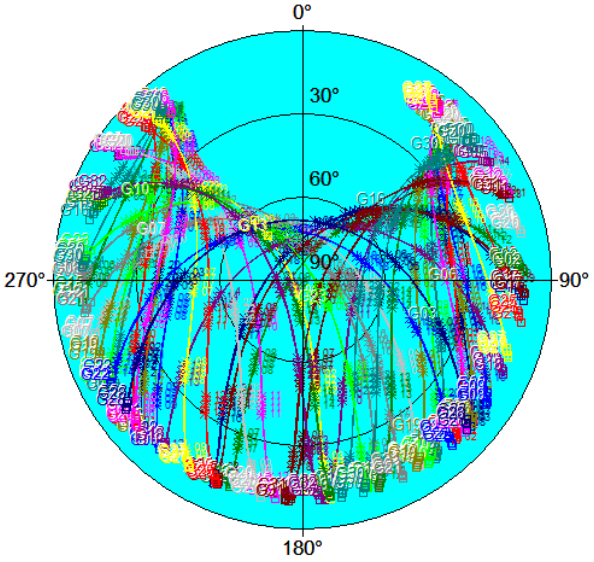
System	2002	2008	2020
GPS	24 satellites	31 satellites	~31 satellites
Galileo		2 satellites	~27 satellites
Compass		1 satellite	~35 satellites
GLONASS	8 satellites	16 satellites	~24 satellites
Total	32 satellites	50 satellites	~120 satellites

GNSS satellite sky tracks

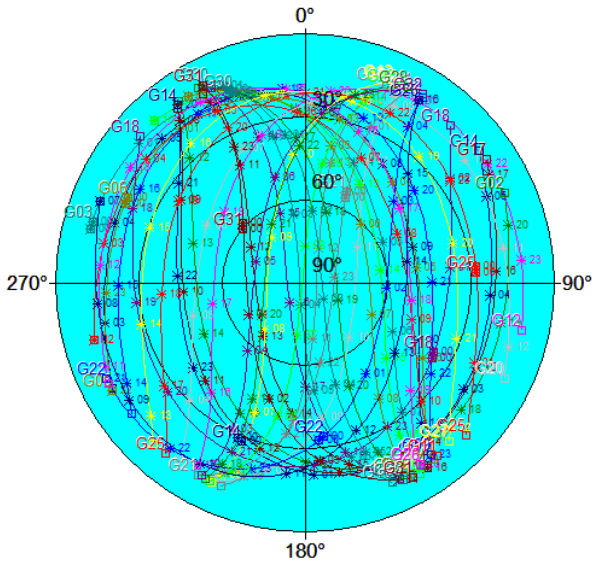
polar

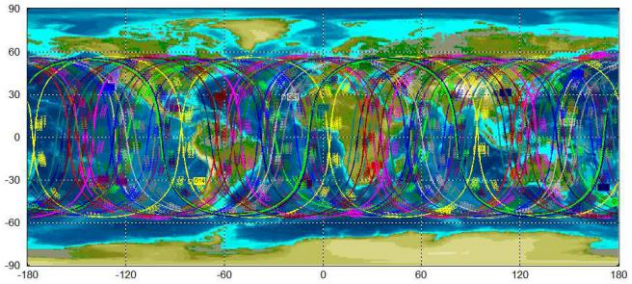


mid-latitude



equatorial



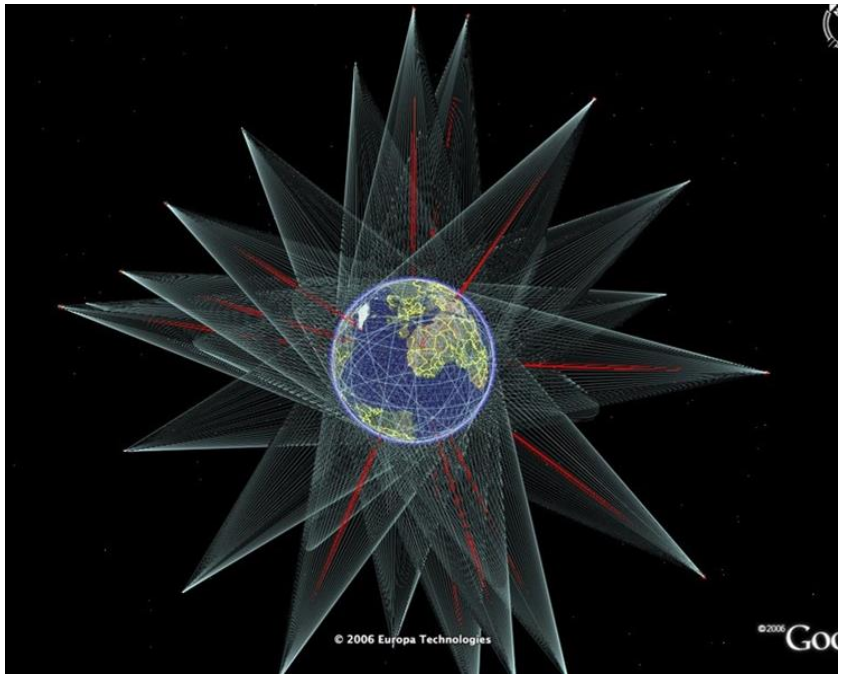


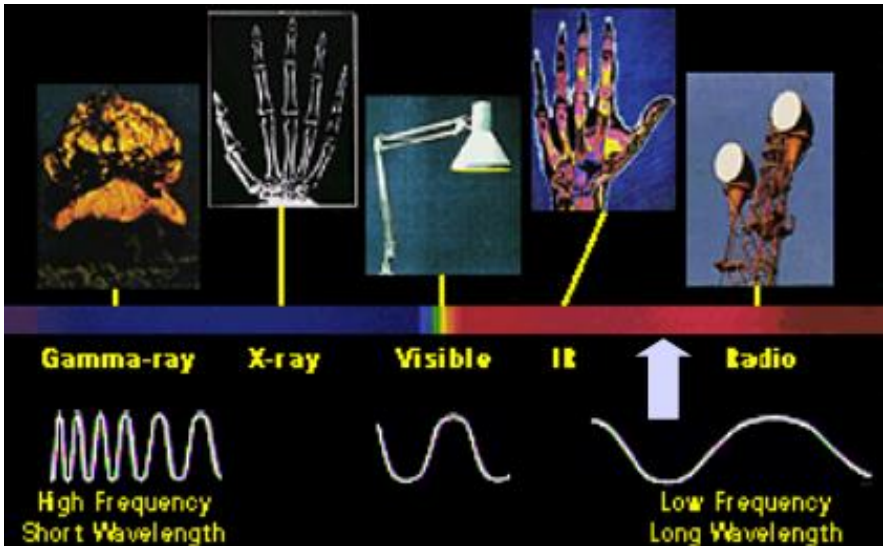
elevation angle (0-90 deg)
azimuth (0-360 deg.)

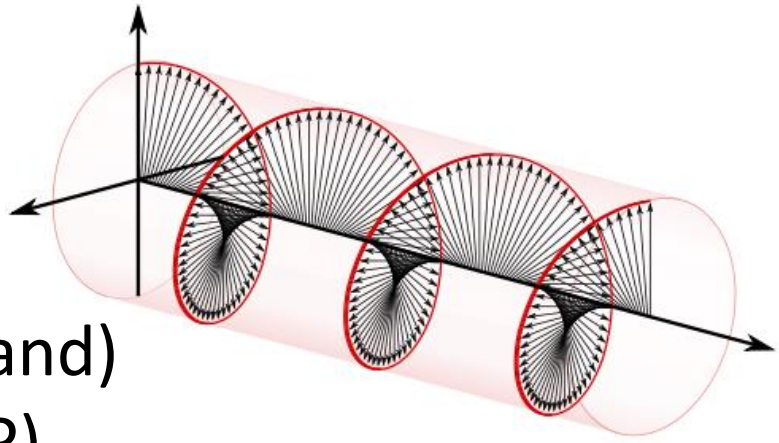
polar hole

rising/setting satellites

GNSS radio waves

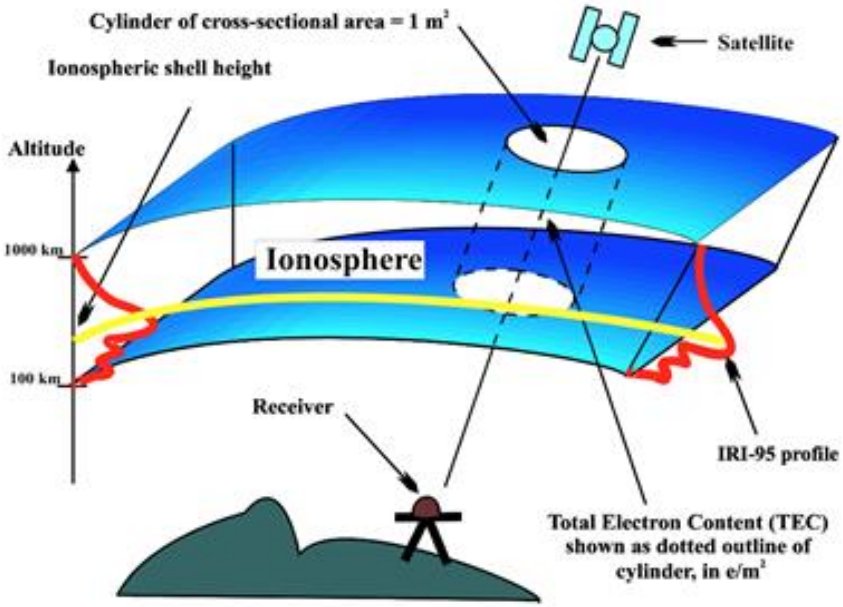




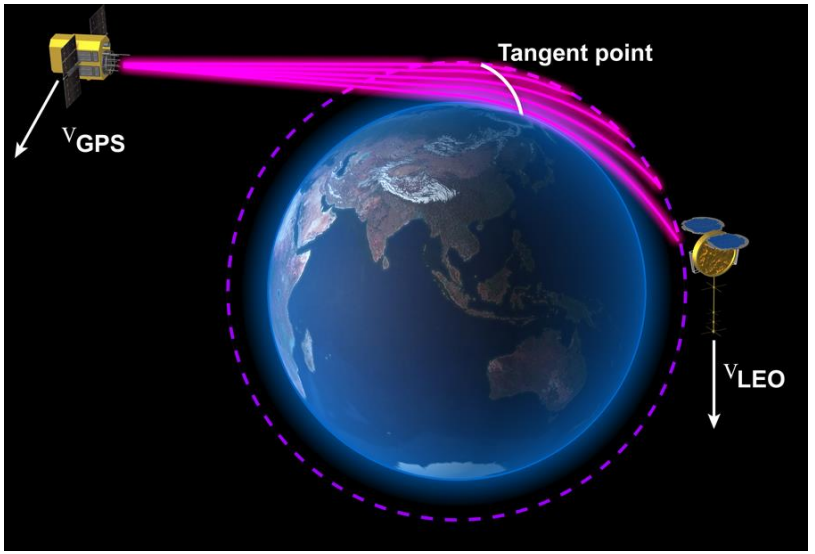


Multiple independent carriers
Carrier wavelength ~ 20 cm (L band)
Polarization: right-handed (RHCP)

GNSS atmospheric remote sensing



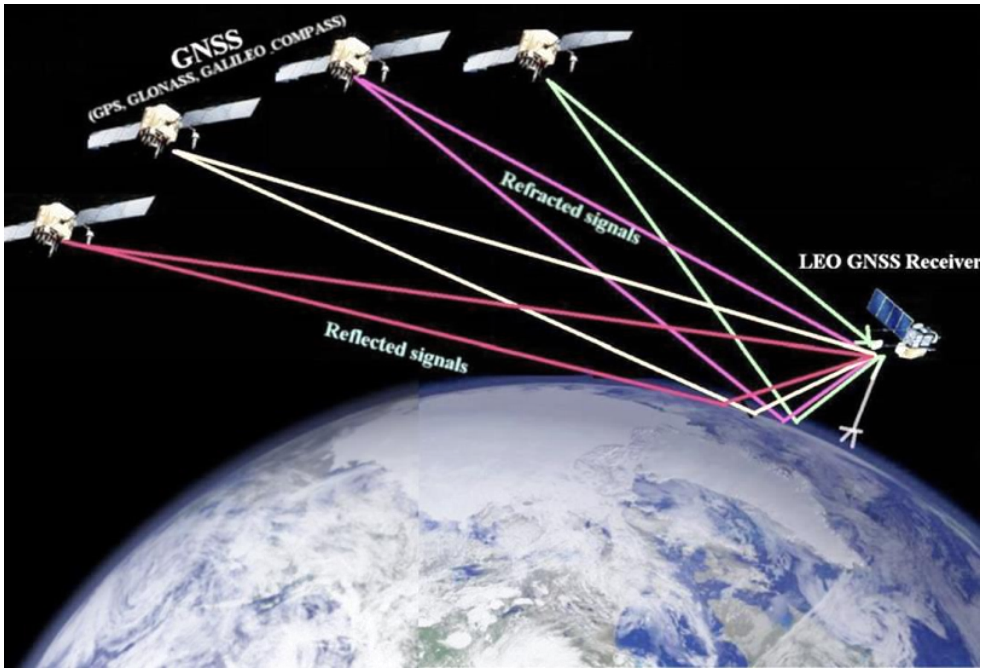
Ground-based
(integrated
GNSS met.)



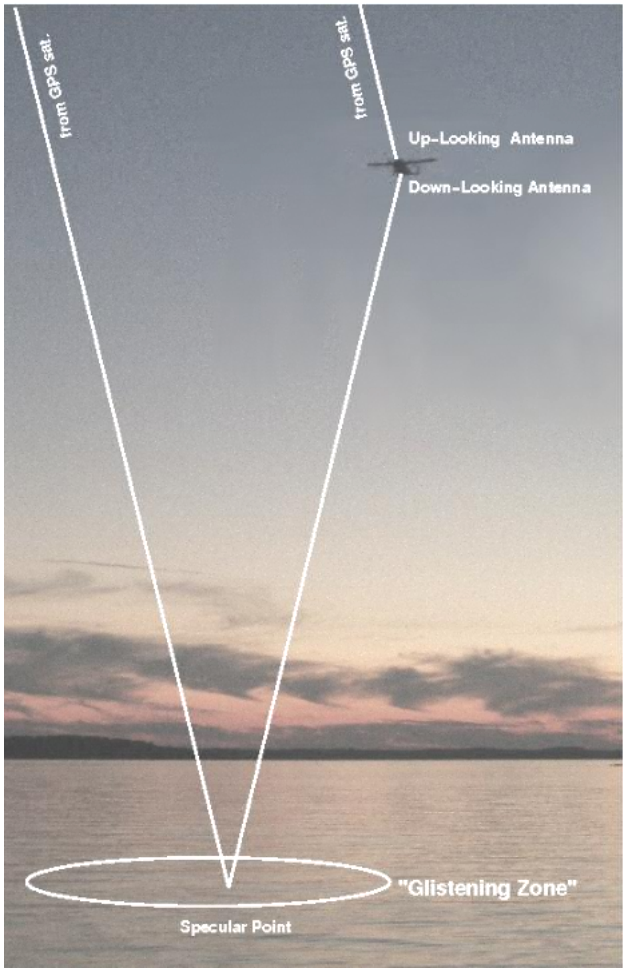
Space-based
(radio occultation
or limb sounding)

GNSS Reflectometry

Dual channel: up/down
(direct/reflection)



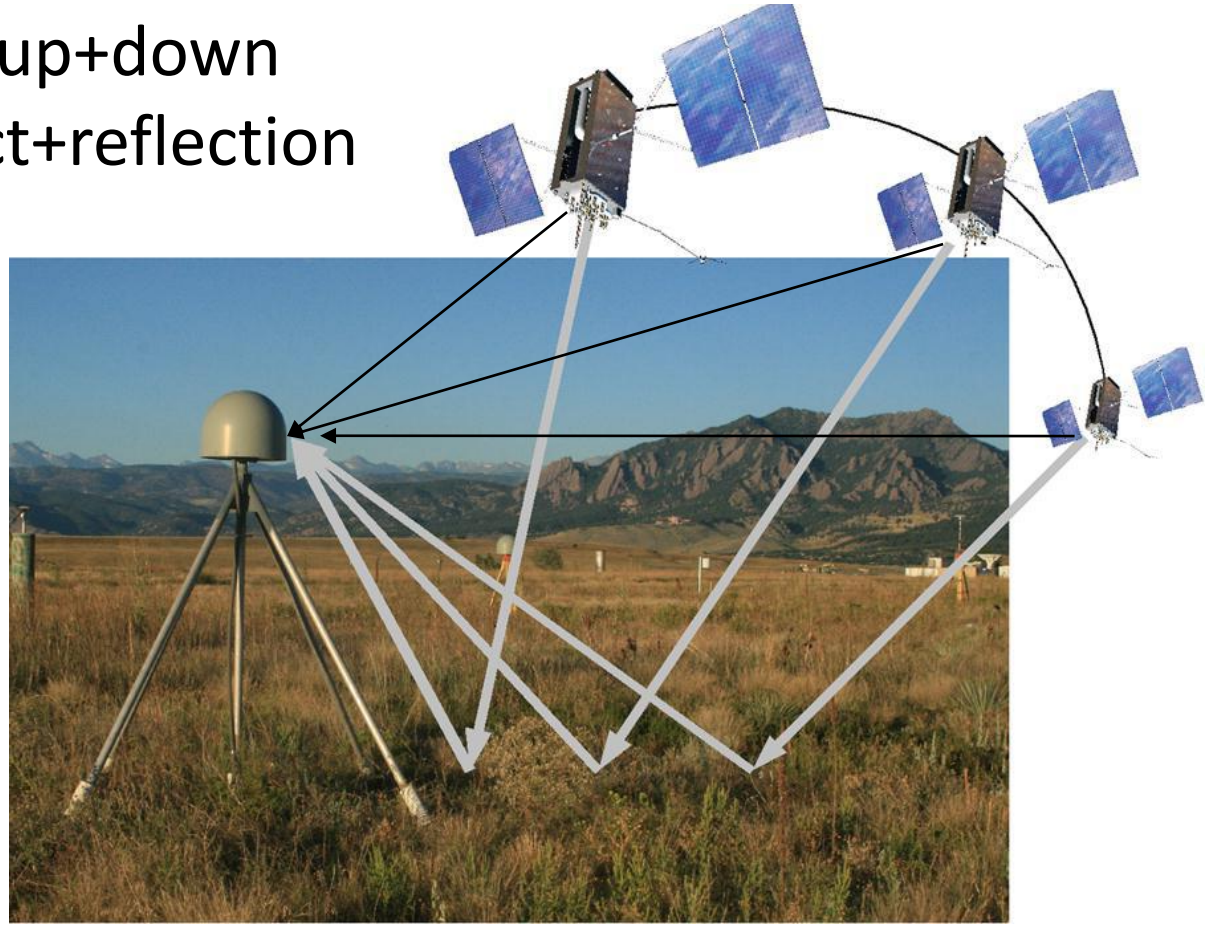
Space-borne



Airborne

GNSS Interferometric Reflectometry

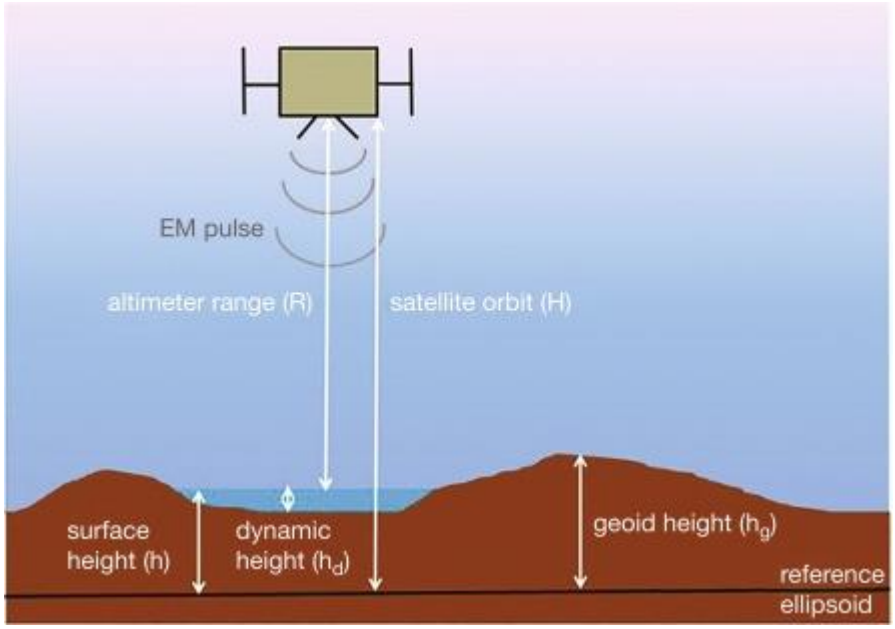
Single channel: up+down
multipath=direct+reflection



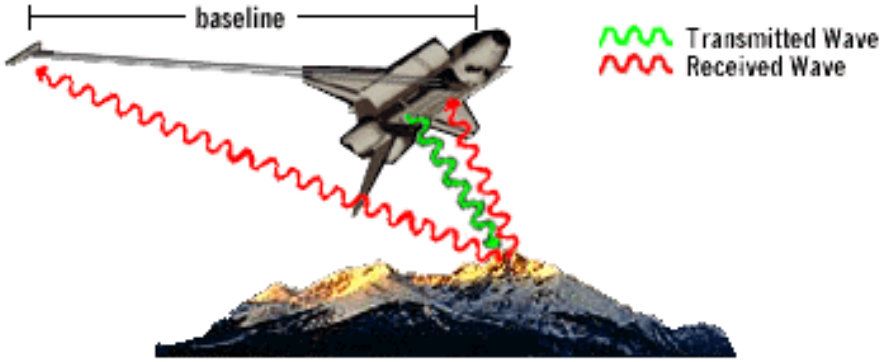
Ground-based

Related radar sensors

Radar altimetry
(monostatic, vertical)



Radar interferometry
(bistatic, imaging)

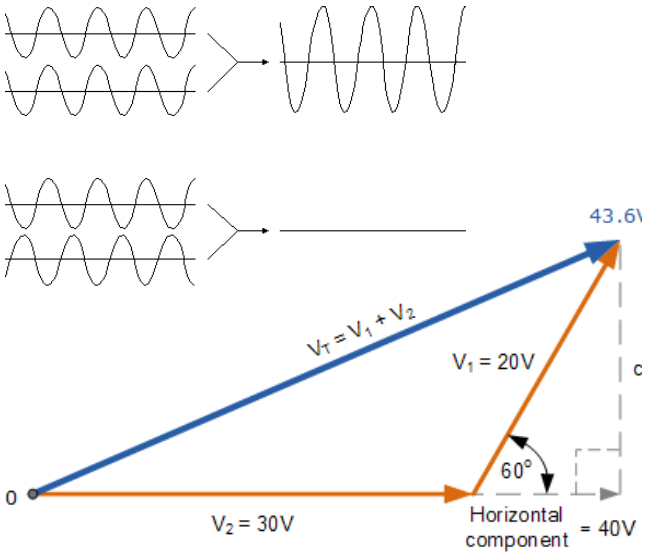


Radar signals being transmitted and recieved in the SRTM mission (image not to scale).

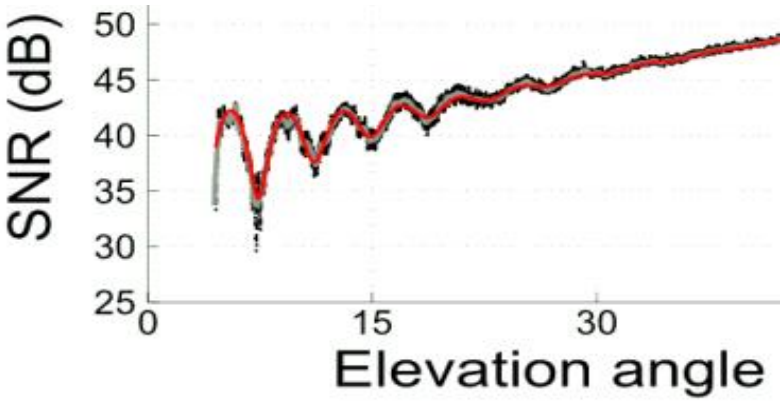
GNSS-R is a type of bistatic radar (non-imaging)

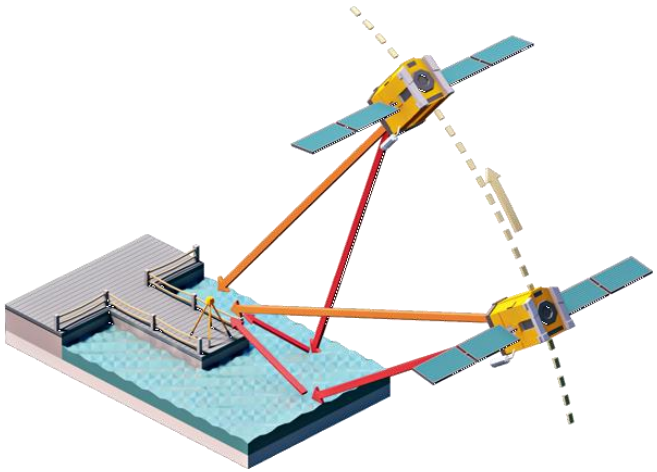
Signal-to-noise ratio (SNR)

- Interference pattern
  - Constructive/destructive
  - Superposition of direct and reflected radio waves



$$SNR \propto P_c = P_d + P_r + 2P_d^{0.5}P_r^{0.5}\cos\phi_i$$
$$= P_d\left(1 + P_i + 2P_i^{0.5}\cos\phi_i\right)$$





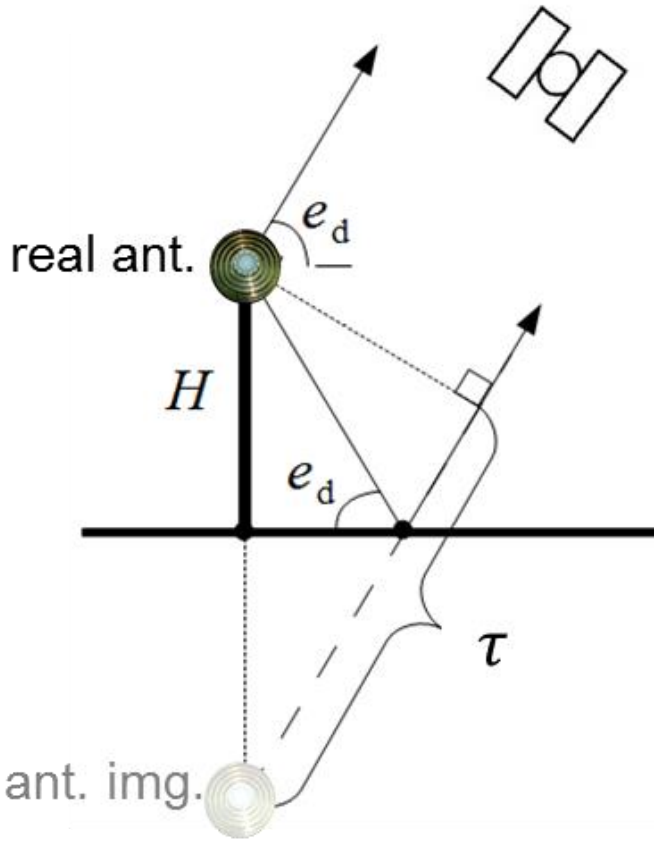
Interferometric delay and phase

- Reflection minus direct propagation distance

$$D_i = \tau = 2H \sin e$$

  - Maximum: 2H @zenith
  - Minimum: zero @horz.
- Non-geometric phase ϕ_X
  - Surface + Antenna
- Total:

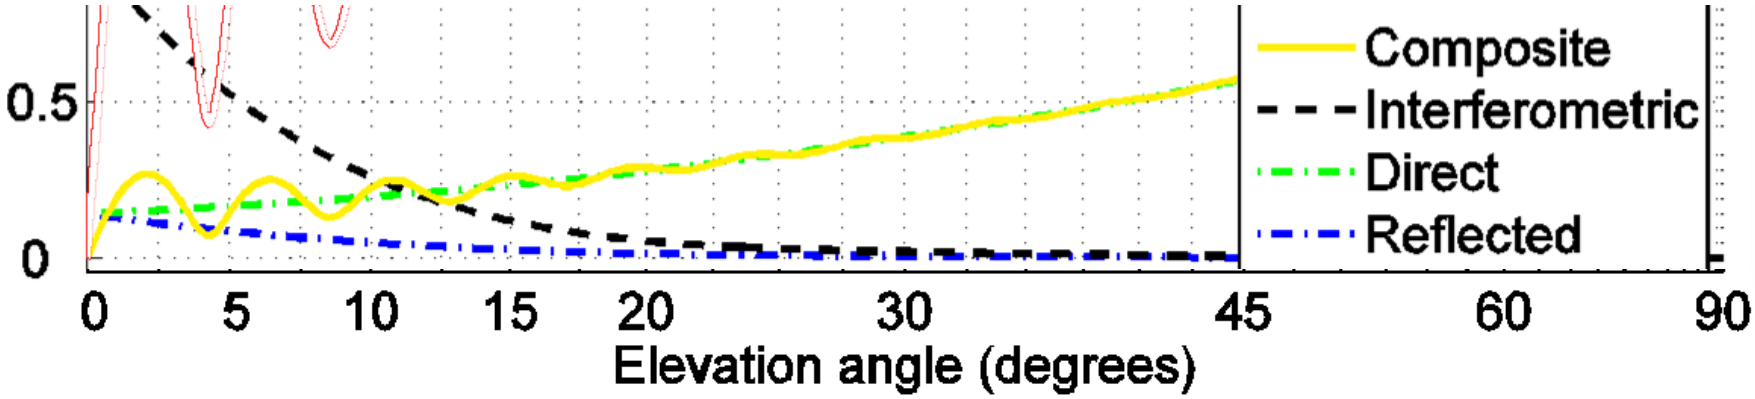
$$\phi_i = kD_i + \phi_X + \cdots$$
$$k = 2\pi/\lambda$$



Interferometric power

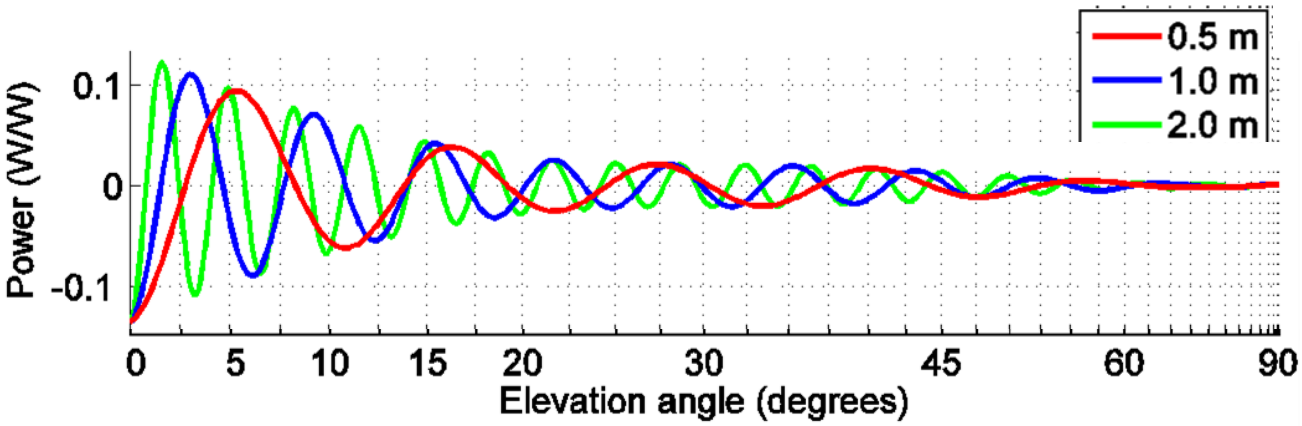
- Reflection power over direct power
- Maximum 1 @horz.
- Minimum zero @zen.

$$P_i = P_r / P_d$$

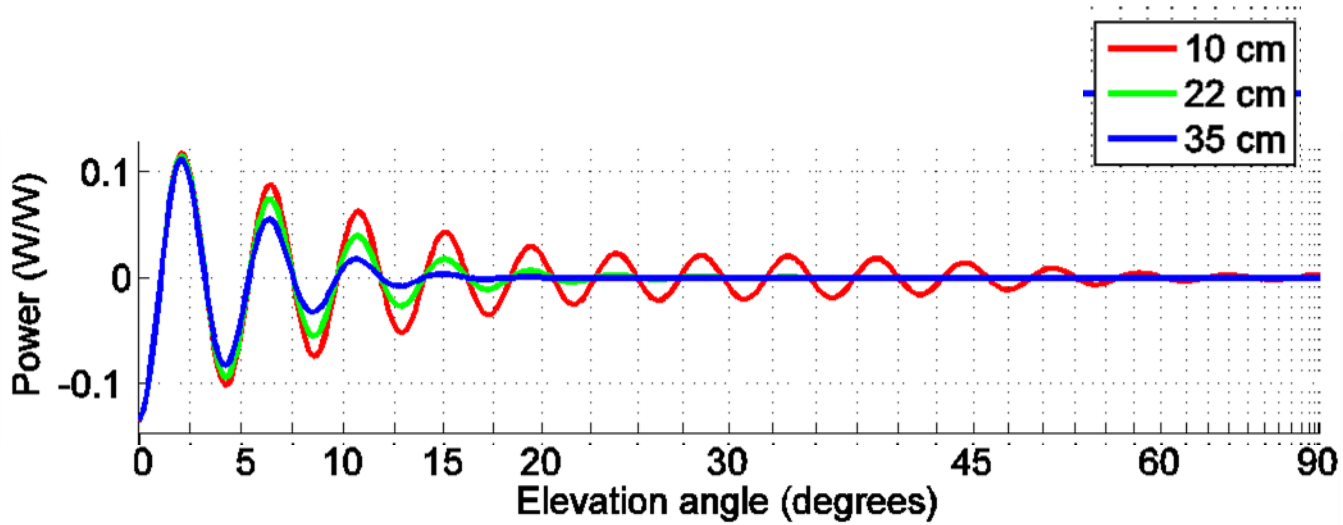


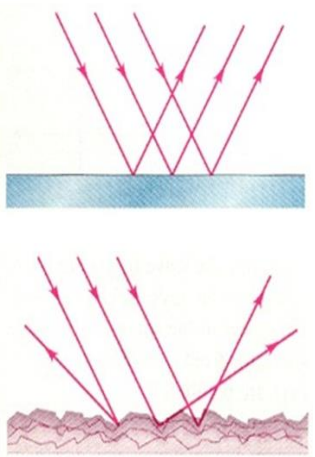
Driven by antenna gain & phase patterns.
Also by surface roughness & material.

Reflector height



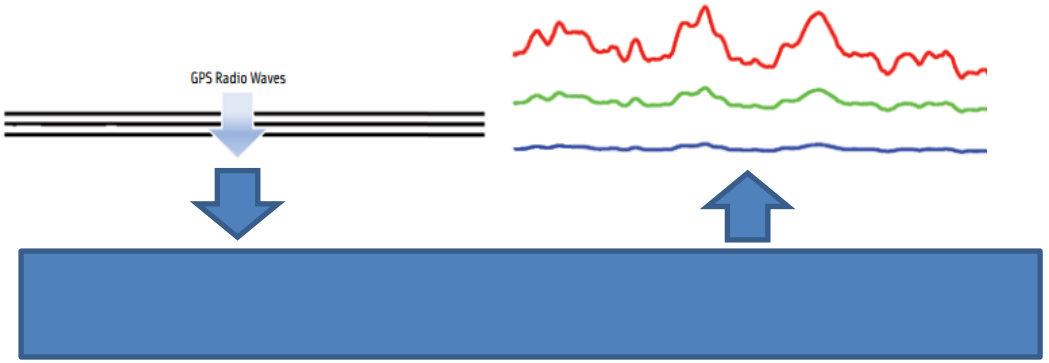
Random roughness



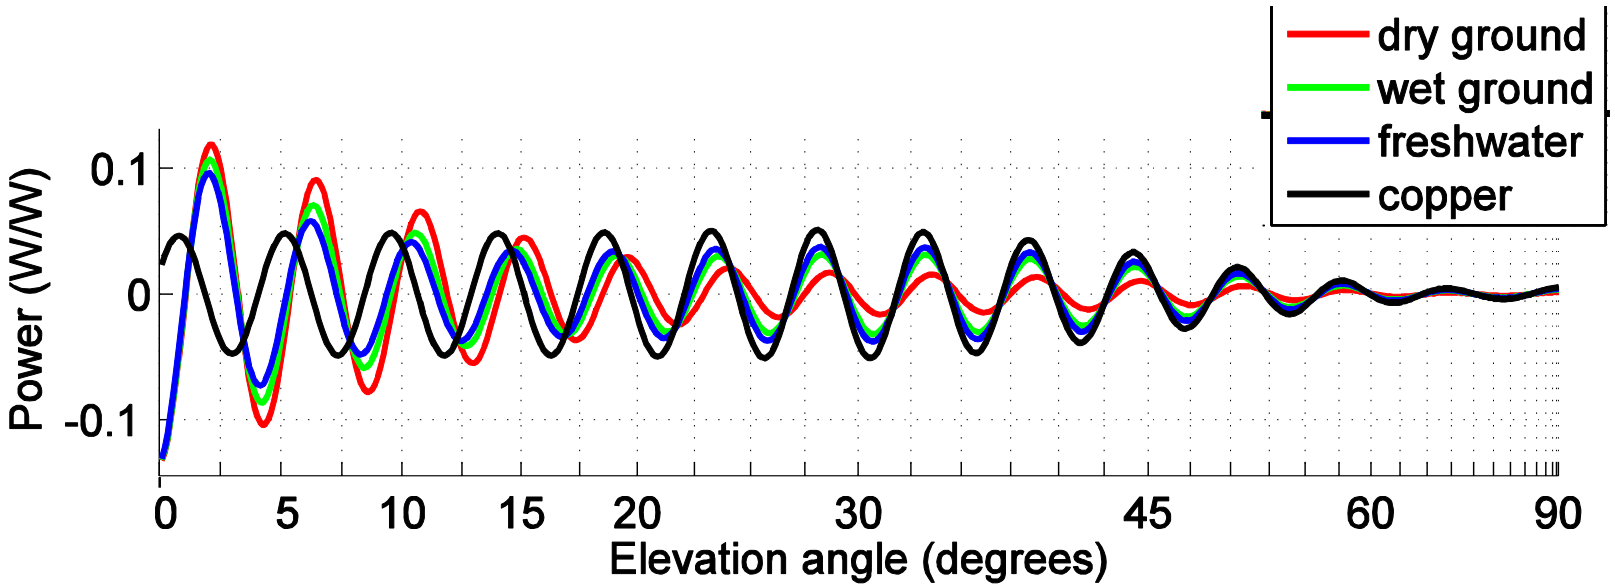


Loss of coherence due to height fluctuations

$$\sigma_{D_i} = 2\sigma_H \sin e$$

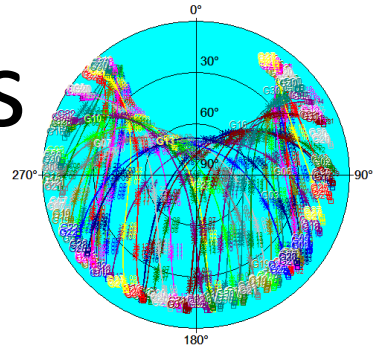


Surface material



Function of complex permittivity (real and imaginary).
Affects both amplitude and phase.

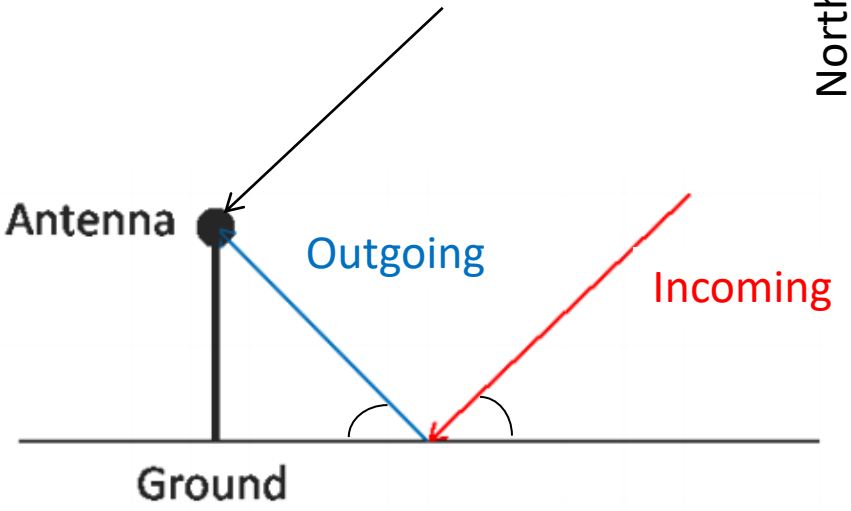
Specular reflection points

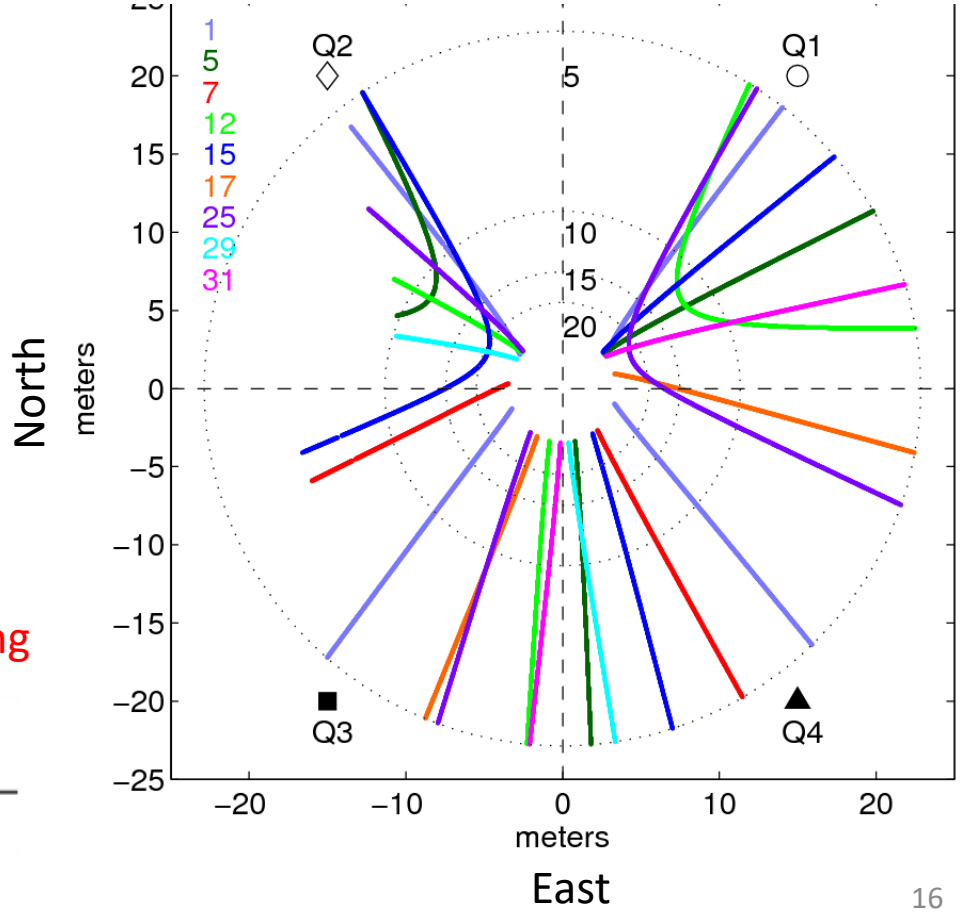


R = h/tan(e)

Geometric Optics

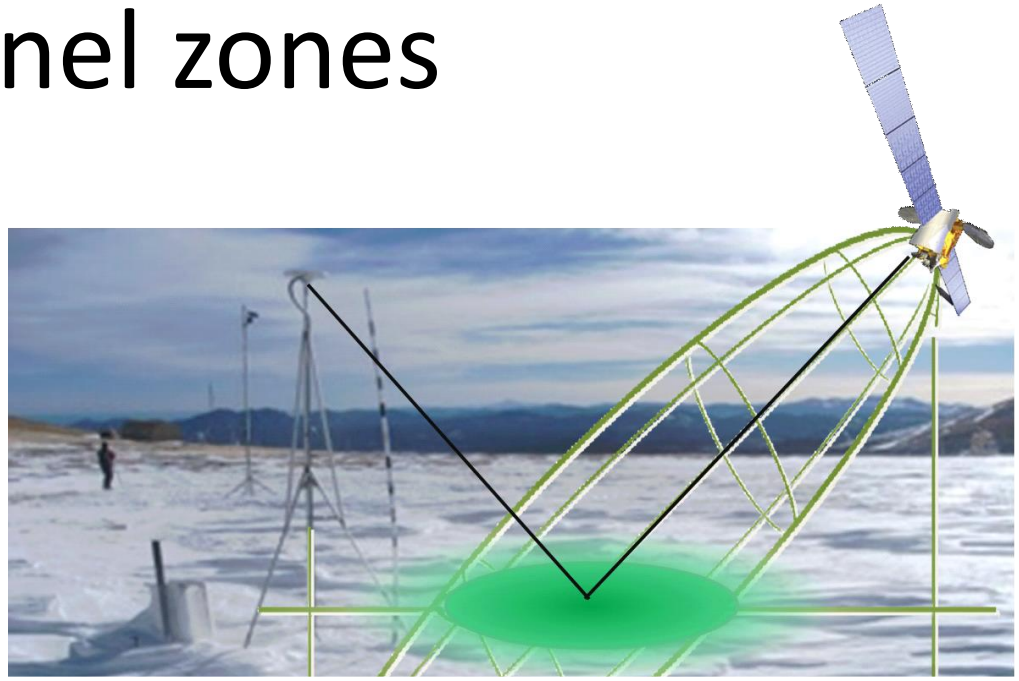
- Thin “rays”
- Direct and reflection
- Snell’s law

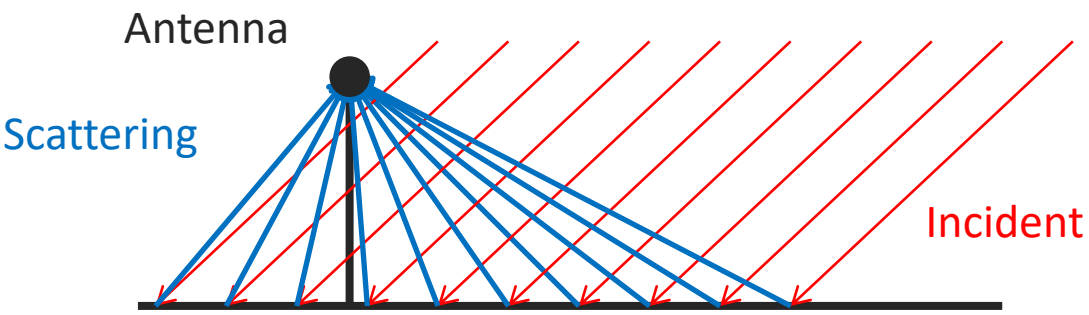


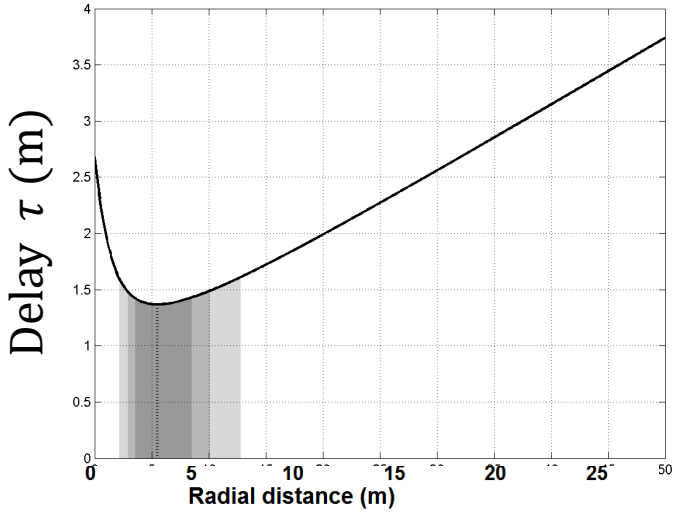


Fresnel zones

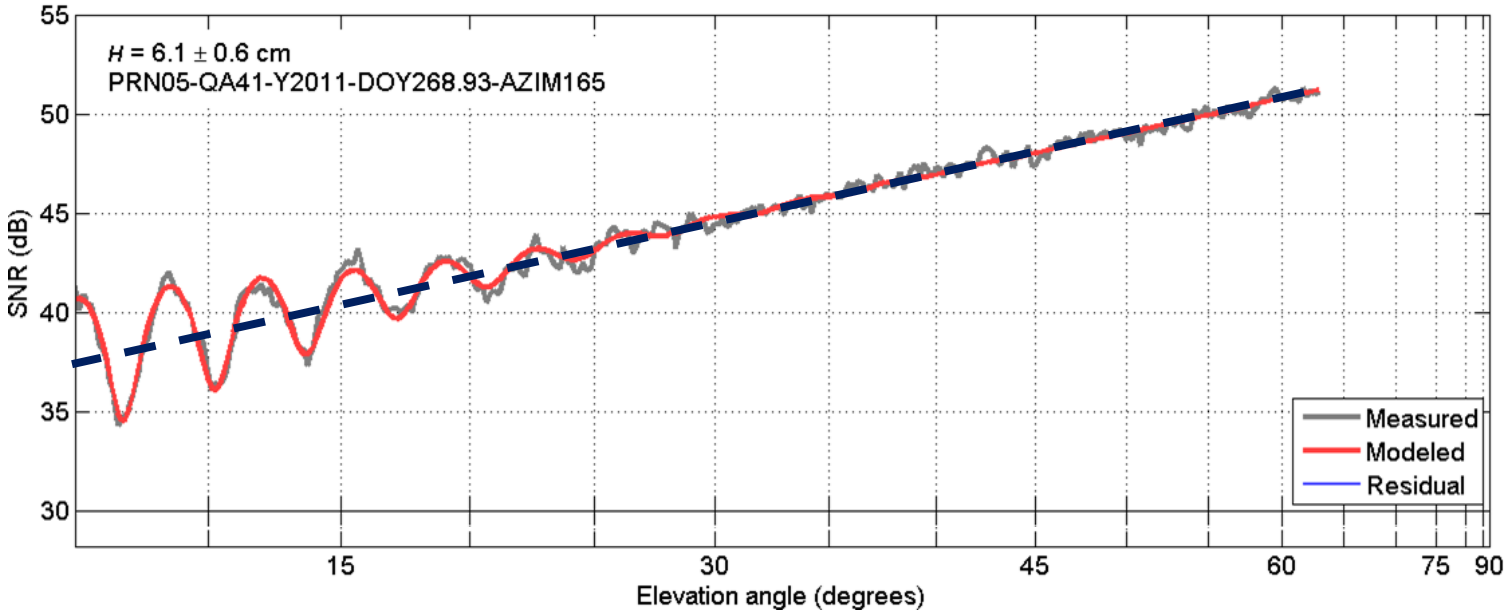
- Physical Optics
  - Ellipses
  - Ray “thickness”
  - Surface wavelets
  - Clearance requirements
  - Gradual tapering
  - (Otherwise, diffraction)







SNR data fitting



total = trend + oscillations:

$$S = \bar{S} + s$$

$$\overline{S} = c_0 + c_1 k_z + c_2 k_z^2 + \cdots$$

$$s = A\cos\left(\widehat{H} k_z + \varphi\right)$$

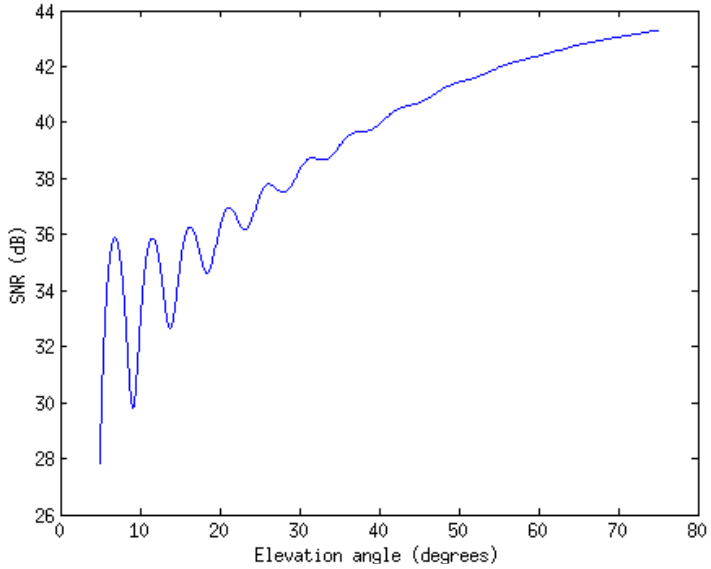
$$k_z = 4\pi\lambda^{-1}\sin e = 2k\sin e$$

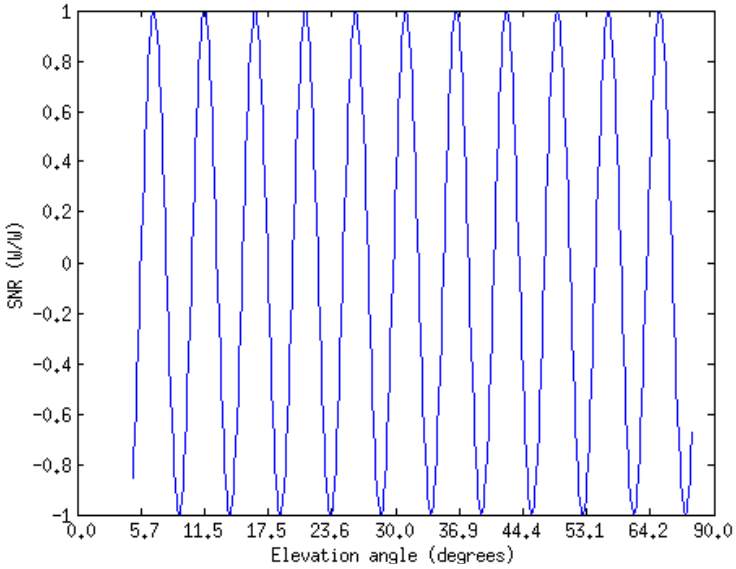
altimetry retrieval:

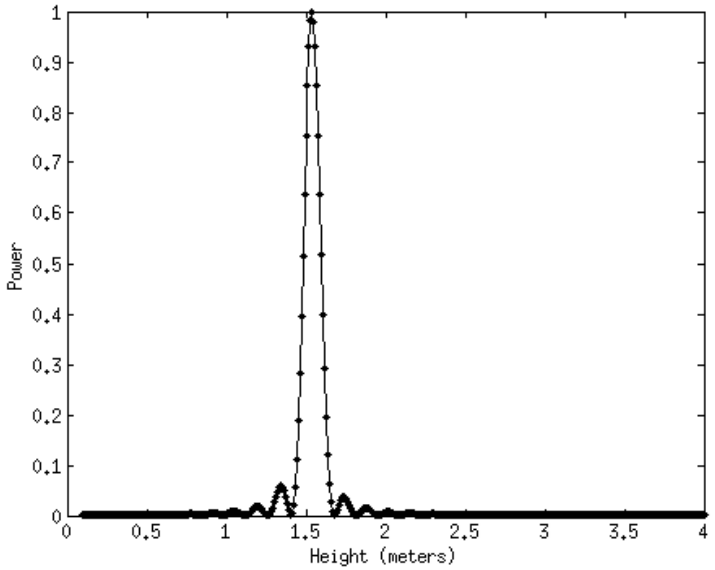
H = (λ/2)*N/

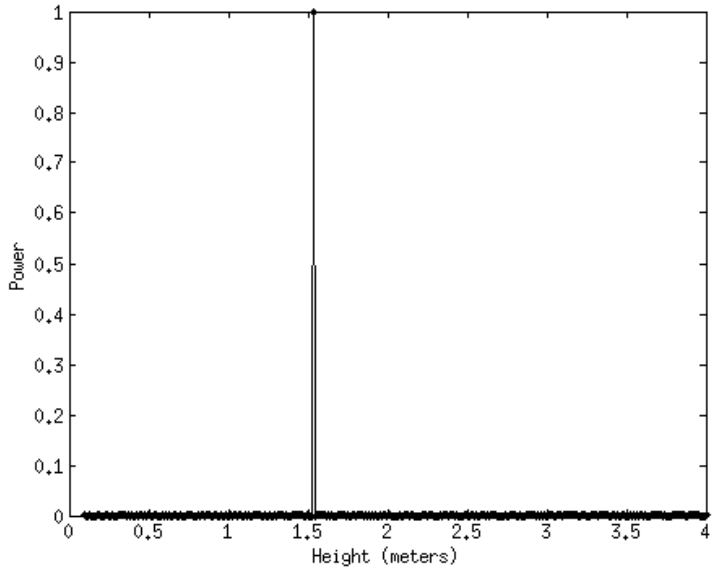
(sen(e2)-sin(e1))

Spectral analysis

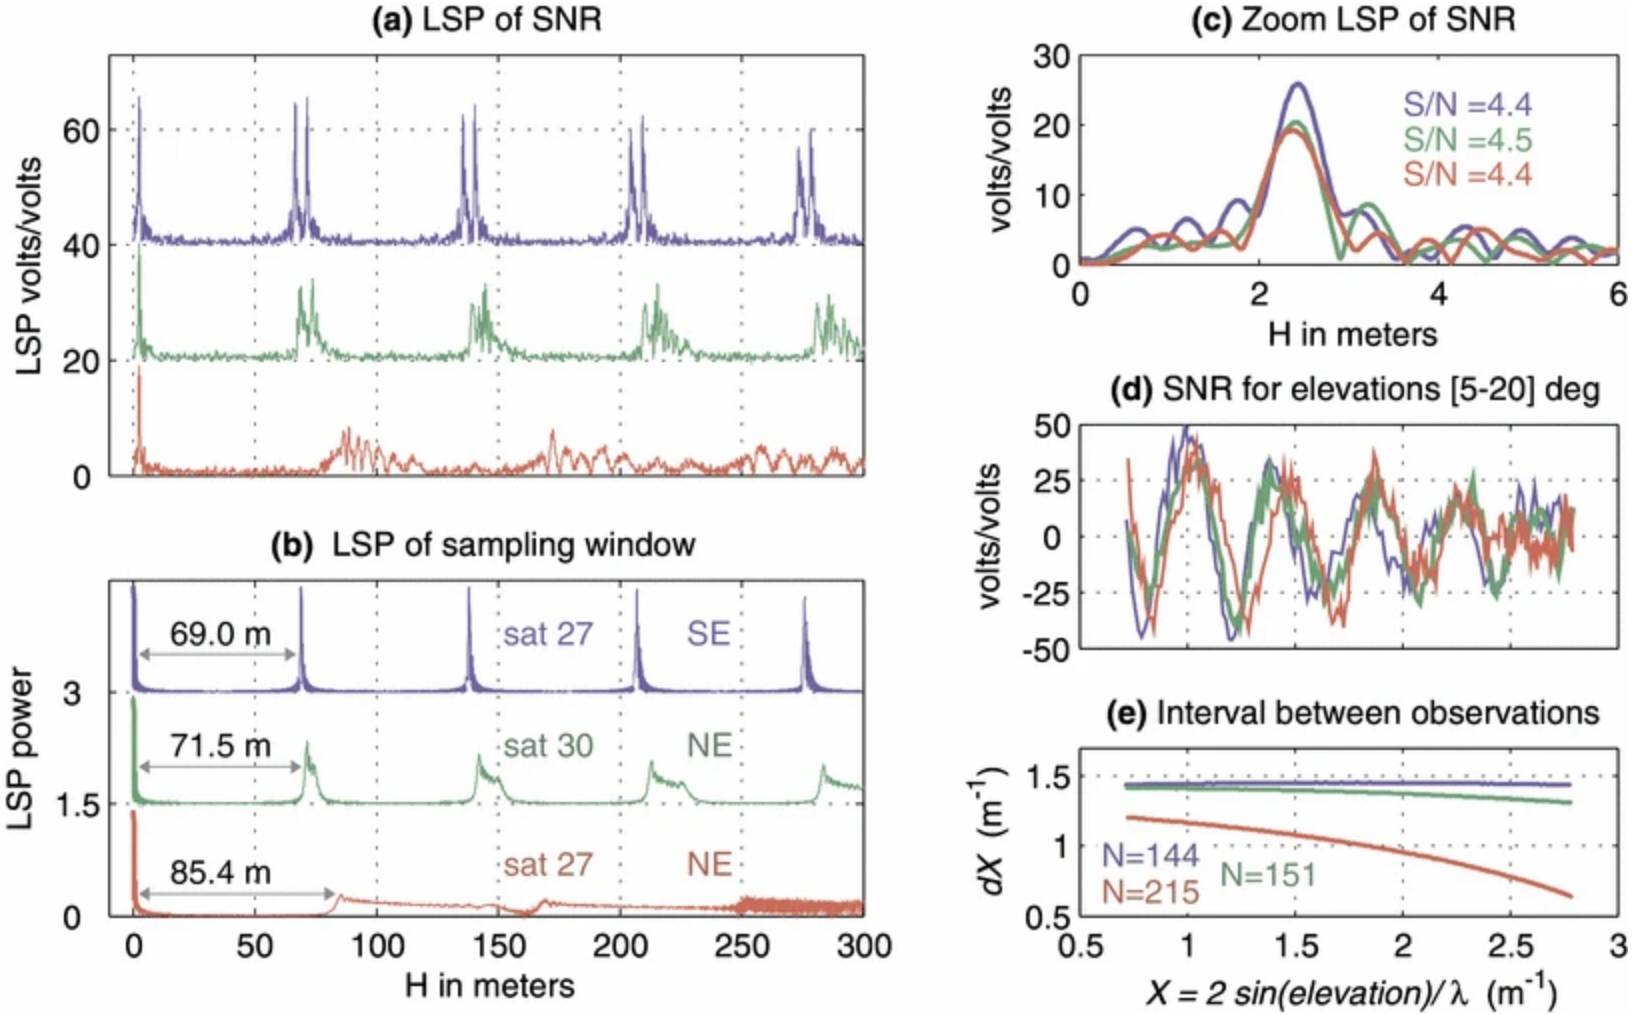








Nyquist frequency



(Roesler & Larson, 2018)
https://doi.org/10.1007/s10291-018-0744-8

Empirical—physical model matching

$$\overline{S} \approx P_d(1+P_i)N_0^{-1},\ s \approx 2P_dP_i^{0.5}N_0^{-1}\cos\phi_i$$

$$c_1 \approx \mathrm{E}\{S/k_z\},\ c_0 \approx \mathrm{E}\{S - c_1k_z\}$$

$$A \approx (2\mathrm{Var}\{s-\overline{s}\})^{0.5} \approx \mathrm{E}\{2P_dP_i^{0.5}N_0^{-1}\}$$

$$\widehat{H} \approx \mathrm{E}\{\partial\phi_i/\partial k_z\},\ \varphi \approx \mathrm{E}\{\phi_i - \widehat{H}k_z\}$$

$$\widehat{H} \approx H + \mathrm{E}\{\partial\phi_X/\partial k_z + \cdots\}$$

Altimetry retrieval will be primarily geometric height plus small non-geometric terms
